

MONAD METROPOLIS · ONCHAIN FINANCE & TRADING

SMT Receipts

An AI trading bot's calls, sealed on Monad before the market moves and graded later against signed prices. Nobody can edit them, me included.

Jannet Akanksha Ekka · solo builder · SMT (Smart Money Trading)

THE PROBLEM

A trading call is easy to fake after the fact.

- Signal groups delete the calls that lost. Screenshots get edited.
- A bot that grades itself is marking its own exam.
- Most people can't tell a real track record from a curated one, so they follow whoever posts the most wins.

WHO'S BUILDING IT

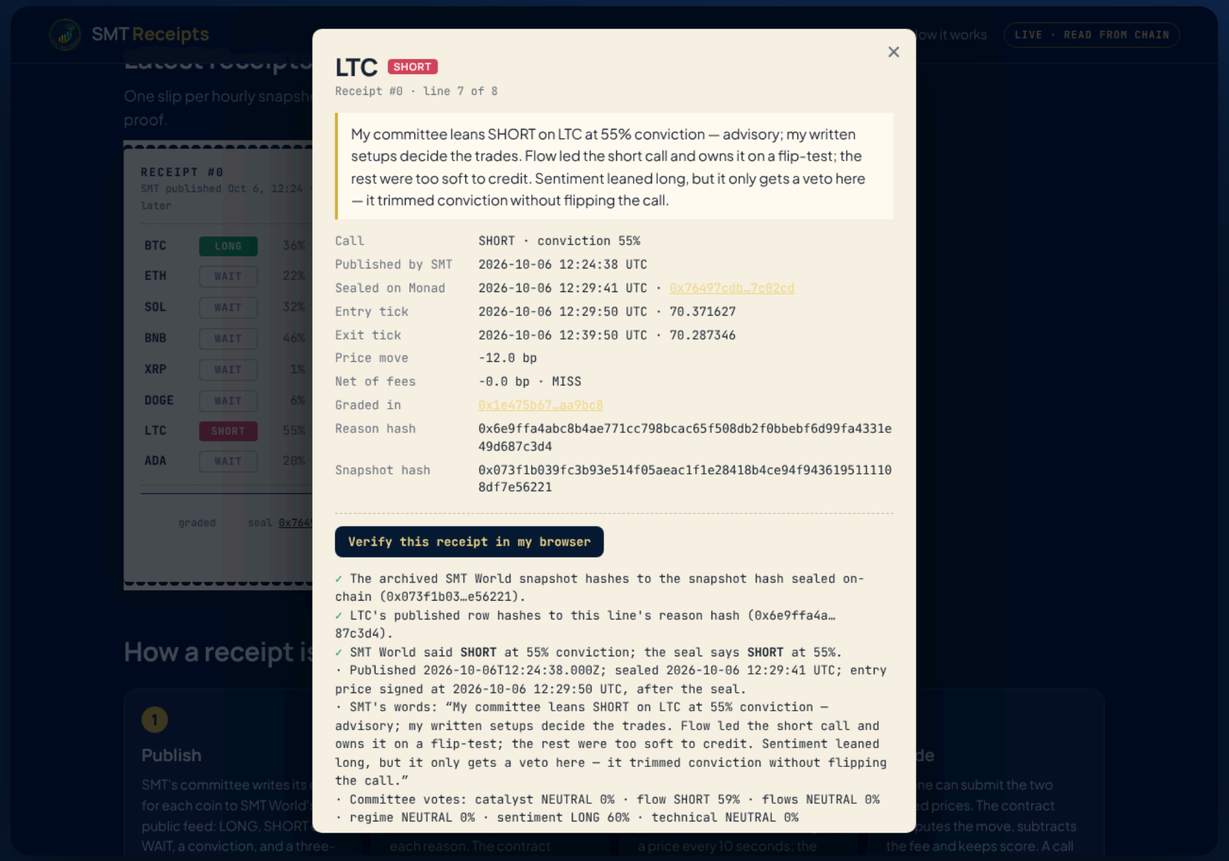

One builder, one bot, since January.

- **SMT** is an explainable AI trading bot: six specialist agents vote on 8 coins and a judge writes the reason in plain words.
- Came **#1 of 230+ teams** in the WEEX AI Wars preliminary, then lost the final. I said so in public, and that is what got the exchange's attention.
- Google Cloud AI engineer, 4+ years at Deloitte before that. Provisional patent filed in India (2026).

THE PRODUCT

One receipt per hour.

- All 8 coins on every slip, **WAITs included**.
- Tap a line: the call, SMT's reason, the seal and grade transactions.
- **Verify** recomputes the hashes in your browser.

HOW IT WORKS

Publish, seal, price, grade.

1

Publish

SMT World posts the committee's call on 8 coins every hour: LONG, SHORT or WAIT, a conviction and the reason.

2

Seal

A keeper writes the whole snapshot to Monad, plus the hash of every reason. Old, repeated or partial snapshots are refused.

3

Price

RedStone signs a price every 10 s. Entry is the first tick after the seal block; exit is 4 h later.

4

Grade

Anyone submits the two signed prices. The contract checks 3 of 5 signatures, subtracts the 12 bp fee and keeps score.

TRUST MODEL

What can't be faked.

Hindsight	The entry price is signed after the call is on-chain.
The price	The contract recovers RedStone's signatures at the exact second. It never takes a number from me.
Cherry-picking	Every coin is sealed every time. A call nobody grades within 22 h counts as a miss that paid its fee.
Edits	No owner, no admin key, no upgrade path. Deployed through a CREATE2 proxy, so the code fixes the address.

WHY MONAD

Cheap enough to seal every call.

- 8 calls per seal, 24 seals a day, plus grades that each carry a dozen signed prices. About 0.015 testnet MON a seal.
- The seal lands seconds after the keeper reads the feed, and the entry tick follows within 10 seconds.
- If every receipt cost real money, you'd only seal the calls you liked. That is the problem again.

LIVE ON MONAD TESTNET

The record so far.

The contract address is fixed by its code: `0xDF9f42AE4f81F086F8495c5a5339dDaa90057993`. The keeper deploys it, then seals every hour.

WHERE IT GOES

Receipts are the trust layer for SMT World.

- **SMT World** is what exchanges buy: their users sign in with their exchange account, arrive funded, and the affiliate fee is split.
- A user copying a bot should be able to check its record. Receipts make that a link, not a promise.
- The registry is open: any trading agent can register and get a record it can't edit. Next: receipts inside SMT World, mainnet, a second agent.

TRY IT

Every call, sealed before the market moves.
